Summary

Looking for a role in a Data Analytics or Data Science Department. Considers himself a strategic and analytical person. Prefers to make decisions that are informed by data. If data-related roles are not available, he is also interested in any software engineering roles.

Technical Skills

Programming and Markup Languages : Python | SQL | Markdown | HTML/CSS

Python Libraries : Pandas | Matplotlib | Seaborn | Plotly | scikit-learn | Natural Language Toolkit | SciPy | NumPy | Beautiful Soup | Requests | Flask (familiar)

Data-related Skills : Importing Data from Various Sources | Interacting with REST APIs | Data Cleaning and Wrangling | Exploratory Data Analysis | Interactive and Static Data Visualization | Machine Learning | Web-server Dashboard Apps with Plotly Dash

Software Tools and Platforms : Git and GitHub | Tableau Public | Visual Studio Code | Anaconda | Jupyter

Work Experience

January 2019 - November 2020 | **Chrysos Aquaculture** | Manager

- Presented financial reports to upper management such as showing the current sources of expenditure, forecasting future expenses, and price comparison from different suppliers.
- Procured hardware, equipment, and material from local and online suppliers.
- Reviewed and approved weekly budget requests before they were sent to upper management.
- Involved in laying off an entire team of people. Ensured transparency with employees about the reasons and ensured that advance notice and severance pay was given.
- Introduced the [Trello](#) app as a management tool to the staff under me so that I could manage assigned tasks through the app and give everyone a sense of how each other was doing in terms of work and backlog.
- Taught bookkeeping staff how to use [GitHub Desktop](#) so that they could collaborate, backup, and apply version control on their files and documents. They were very grateful that it detected merge conflicts!
- Held Town Hall Meetings to communicate company news to employees and to hear out employee concerns. Responded to and followed up on the concerns being raised.

June 2017 - December 2018 | **Maxim Integrated** | Test Product Engineer

- Debugged and maintained semiconductor product test programs/code that were already deployed in production. They were written in Visual Basic and C++.
- Analyzed, and presented data for an A/B test comparing two different materials of a Test Platform component to see whether it reduced damage to products induced during testing.
- Identified a product which had a consistent history of passing certain tests. Used data of present and past performance to show that removing those particular tests from the test process would not result in a negative impact on quality. Implemented and committed the reduction of the tests from the test program.
- Underwent in-house training on the basic concepts of Six Sigma DMAIC, and other problem-solving methodologies such as 8D and 3x5 Why.

Open-Source Contributions (GitHub Handle: max-torch)

Time Tracker | [Pazitos10/time-tracker](#) | Time-tracking application written in Python

- Authored code that allows the app to generate data visualizations from the user's data. [View pull request](#)

Battle For Wesnoth | [wesnoth/wesnoth](#) | Cross-platform, turn-based fantasy strategy game

- Proofreading, improvements, and additions to in-game dialog and text.
- Suggested and implemented some feature enhancements to campaign scenarios.
- Closed some issues with the in-house developer tools. Had to install an Ubuntu OS in a Hyper-V VM in order to verify that fixes and features were functional in Linux as well as Windows.
- Learned how to work with the in-house programming language known as WML by reading the project documentation, looking at examples in the existing code, and communicating with the current Project Development Team on Discord.
- Learned how to work with in-house developer tools written in Python.

Selected Project Highlights

- Created a Shopify Private App that fetches data from a Shopify Store using Shopify's Rest Admin API and presents a dashboard containing aggregated data to the user. View the [project's GitHub repository](#) to see partial progress.
- Authored a [Medium Article](#) called "Make Others Want to Work with Your Code" that was selected for further distribution by Medium's curators which still gets views and shares every week.
- Explored, and analyzed with machine learning, data from the online dating platform OKCupid as a portfolio project while going through courses on Codecademy. Machine learning algorithms showed that describing one's body as curvy was a predictor that a user was female. A [blog article](#) discusses the entire project.

Informal Education

- [Codecademy Computer Science Career Path](#) | August 2020 - November 2020
- [Codecademy Data Scientist Career Path](#) | November 2020 - June 2021
- [Kaggle 30 days of Machine Learning](#) | August 2021 - September 2021
- Self-learning from online articles, videos, and projects | September 2021 - Present

Formal Education

- University of St. La Salle | Bachelor's Degree in Electronics Engineering | 2013 - 2016
- Technological University of the Philippines | Electronics Engineering Technology | 2009 - 2012

Additional Accomplishments

- [Topped the Philippines Electronics Technician \(ECT\) Licensure Exam April 2017](#)
- Finished the ten speeches [Competent Communicator](#) Path of Toastmasters International

Fun Fact: This resume is itself a coding project. Initially, it was written in Markdown. Then it was converted to HTML using a VSCode extension. Then it was stylized and converted into a PDF using a Python script and a CSS stylesheet. Finally, Git version control is used to manage the different versions of my resume I send to different employers. [View it on GitHub](#)
